SafeHome AI Recording Plan and Script

Three minute Congressional App Challenge video

Purpose This document gives the exact order, timing, narration, and screen actions for recording the final video. Six presentation slides explain the project and four app clips demonstrate it. The app is on screen for 110 of the 180 seconds.

Final video structure

Time	Media	Length	Purpose
0:00-0:08	Slide 1	8 sec	Introduce the problem and SafeHome AI.
0:08-0:33	Clip A	25 sec	Start a Quick Safety Check and upload a photo.
0:33-0:45	Slide 2	12 sec	Explain Quick Check and saved Account Check.
0:45-1:20	Clip B	35 sec	Show hazards, follow-up questions, and the score.
1:20-1:32	Slide 3	12 sec	Explain the image-review and validation process.
1:32-1:57	Clip C	25 sec	Show the safety plan and comparison after fixes.
1:57-2:09	Slide 4	12 sec	Explain how the bounded score is calculated.
2:09-2:21	Slide 5	12 sec	Present the testing results.
2:21-2:46	Clip D	25 sec	Show saved progress, email, and accessibility.
2:46-3:00	Slide 6	14 sec	Close with the practical value of the app.

Complete narration and screen directions

0:00-0:08 Slide 1

Narration I built SafeHome AI to help older adults and families find room hazards before those hazards become accidents.

Screen direction Hold the opening slide. Do not animate individual words.

0:08-0:33 Clip A

Narration A first check does not require an account. The user chooses a room, uploads one photo, and the app checks image quality before analysis.

Screen direction Begin on the landing page. Click Quick Safety Check, choose Bedroom, continue, upload the staged room photo, pause on the preview and photo-quality result, then click Analyze. Keep the cursor slow and visible.

0:33-0:45 Slide 2

Narration Quick Check removes setup from the first experience. An account uses the same analysis, then adds Room Names, history, comparisons, trends, and sharing.

Screen direction Hold the slide long enough for both paths to be read. Use a simple dissolve from the previous clip.

0:45-1:20 Clip B

Narration Numbered markers connect visible evidence to plain-language explanations. The app asks about important details a photo cannot prove. Those answers combine with the visible hazards to produce a bounded room score.

Screen direction Start on the results page. Hold the marked image, then scroll through two hazard cards. Continue to the follow-up questions, answer two questions, and proceed until the numerical score and colored risk bar are visible. Pause on the score.

1:20-1:32 Slide 3

Narration Vision AI suggests visible hazards and approximate coordinates. The app validates every category and score, while important uncertainty becomes a human question instead of a claim.

Screen direction Hold the process slide. Let the viewer follow the four steps from left to right.

1:32-1:57 Clip C

Narration The result becomes a short action plan. A later photo shows which hazard categories were resolved, which remain, and whether anything new appeared.

Screen direction Show all three recommended actions. Select Compare After Making Fixes, use the prepared recheck result, then pause on Resolved, Still Present, and New. Avoid rapid scrolling.

1:57-2:09 Slide 4

Narration Each visible hazard receives one to fifteen points. Follow-up answers add evidence, skipped questions can add a limited buffer, and the final room score stays capped at one hundred.

Screen direction Hold the score slide. The three inputs and low, moderate, and high ranges must remain readable.

2:09-2:21 Slide 5

Narration I tested ten staged room images containing thirty-five reference hazards. SafeHome AI correctly reported thirty-four and missed one, for a ninety-seven point one percent detection rate.

Screen direction Show the full testing table without zooming or panning. Keep the total row and 97.1 percent result visible.

2:21-2:46 Clip D

Narration Saved checks track progress by room. The dashboard shows trends and comparisons, summaries can go to trusted people, and accessibility controls remain available throughout the app.

Screen direction Open Room-by-Room Stats. Show unique rooms checked, the score trend, and the before-and-after comparison. Open an email section, add one extra recipient, then briefly open Accessibility and change one setting. Use a demo email address.

2:46-3:00 Slide 6

Narration SafeHome AI helps families notice possible room hazards, understand why they matter, and decide what to do next. It turns one photo into a practical starting point while keeping people in control.

Screen direction Hold the closing slide through the final sentence, then leave one second of silence before ending.

Clip recording checklist

- Record at 1920 by 1080 and 60 frames per second.
- Use the same browser size, zoom level, light theme, staged room, and demo account throughout.
- Hide bookmarks, notifications, personal email addresses, and unrelated browser tabs.
- Leave about one second still at the beginning and end of every clip for clean edits.
- Move the cursor slowly and perform one clear action at a time.
- Do not speed up scrolling enough to make labels unreadable.
- Pause on the marked image, the final score, the testing result, and the before-and-after comparison.
- Record each clip at least twice and keep the smoother take.
- Use a staged room photo and demo recipient addresses in the final recording.

Editing checklist

- Use only Slides 1 through 6 from the presentation. The production-reference slides do not belong in the video.
- Keep the final runtime at or below three minutes.
- Use simple cuts or short dissolves. Avoid animated templates and decorative transitions.
- Keep app clips at normal speed unless a very small trim is needed.
- Match each narration block to its listed slide or clip before adding music or captions.
- Add readable captions and check that they do not cover buttons, scores, or testing totals.
- Keep background music quiet enough that every word remains clear.
- Watch the complete export on a phone and a laptop before submitting.

Final quality check

The finished video should feel like a guided app demonstration, not a slideshow. The viewer should see the complete path from starting a check to receiving evidence, answering follow-up questions, viewing the score, acting on recommendations, tracking progress, and sharing a summary.
